SINTERED STONE = VERSATILE MATERIAL

Our Sintered Stone is made of selected natural minerals and inorganic clay, and is pressed by a 36,000-ton press at a temperature as high as 1,300°C, giving it a tough texture and strong physical properties.

Our Sintered Stone breaks through the application limit of wall and floor decoration materials. It has the basic functions of ceramic tiles and can also be used as a panel.

It's large, light, hard and tough. All these features allow it able to support secondary processing such as cutting, grooving, and drilling. At the same time, it also has excellent performance such as fire resistance, wear resistance, stain resistance, acid and alkali resistance, and easy to clean. It is quite suitable for making dining tables, coffee table countertops and also for serving as cabinet panels such as bathroom cabinets, kitchen cabinets, TV cabinets, etc., providing a variety of customization methods for different spaces.

In other words, the essential difference between our sintered stone and ceramic tiles is the difference between household materials and just wall or floor tiles.

SINTERED STONE = PERFORMANCE BEAST

Food Grade Surface — formaldehyde-free, anti-mold and mildew, more hygienic

Strong Physical Properties — high density, easy to process, easy to clean, super durable

Resistance to Impact and scratch

Fireproof and resistance to high temperature

Impermeable and resistance to stain

Formaldehyde-free and resistance to mold and mildew
